

## Image Search

Application should perform search for image using flickr service without using Flickr SDK for iOS.

### Task:

1. Implement simple UeX interface using default (or not default) Cocoa graphic elements.
2. Implement image search by keyword entered by user (using search field or text field)
3. Implement image gallery previews with number of columns selection (1, 2 or 3)
4. Implement detailed image view with zoom and rotation features (and scroll between images as a bonus).

### Requirements:

1. Application performance.. Everything should be smooth.
2. No crashes.
3. No memory leaks
4. No stucks
5. Support all orientations and all iPhone devices (iOS 9.0+) (iPad could be a bonus as creative work if you'll get more time)

You can use any 3d party framework except frameworks for Flickr networking. Application could be done with SWIFT or ObjC languages and you can use any way to implement GUI (From code, storyboards or XIBs).

Need to use latest xCode for development and any free Git repository (bitbucket, github etc...).
